

Manufacturing

Focusing specifically on small and medium businesses, Moxx empowers customers with the right tools to manage their business processes. Using innovative delivery mechanisms and open source technologies, our solutions allow customers across industries to deploy and configure ERP systems at a fraction of similar alternatives in the market.

Our ERP implementations acknowledge that training, change management and usability matter as much as system functionality in order to ensure success of a project. By having our solutions work around business processes, rather than system modules – we improve user adoption and reduce information silos. By integrating world-class reporting and analytics solutions into the applications, we ensure that you have timely and accurate information from multiple business processes. With real-time information on shop floor activities and material, managers can plan production runs better and instantly identify bottlenecks. Using open standards allows supplier and partner organizations to plug into the ERP infrastructure, to create a truly connected supply chain.

Our web-based deployment platform reduces cost of maintenance and deployment, and ensures that system capacities grow to cater to your growing business demands. To learn more about how Moxx can deliver ERP solutions for your business and industry, please contact us .
