

Reporting and Analytics

Our web-based reporting and business intelligence solutions allow you to generate actionable intelligence for each employee in your organization. You can now publish real time charts with drilldown data for each business process, and even deploy it to your website to create personalized graphics for partners and customers.

At Moxx, we provide reporting and BI modules for use for all our implementation solutions. We also provide open-platform reporting and analytics engines which can connect to your legacy applications to generate rich, graphical business intelligence.

Not only can you print pixel-perfect reports for print or web, but also export data into PDF or spreadsheets for further analysis. Our business intelligence solutions support drilldowns, interactive pivot tables and the ability to publish or schedule reports for sharing with a team.

By moving from desktop based reports which build silos of information, your business can benefit from centralized real-time access to all information. The self-service nature of our applications, and being able to integrate reports into applications increases productivity by instantly providing employees with the data personalized for their job roles.

In the long run, deploying a organization-wide reporting platform not only pays for itself by lowering the cost of information delivery, but improves customer satisfaction. You can have employees answer enquiries and provide status updates instantly, enable customers to login into self-service reporting portals, and in general reduce the cost of interaction and information gathering.
